

**Auto-site, the A to Z of autos.** Auto cars have been at the core of engineering and design for over a century. We are about to face the biggest change in auto design in that time, the change from gas driven CO2 emitters to the clean-tech green machines that run on renewable energy. Electric and hybrid cars are about to become mainstream. The change will shake the foundations of the industry and the way we travel. So much so the change has been put off for decades and avoided until the 'writing is on the wall'. Oil is about to get very expensive and in very short supply.

We do not want to forget the rich history of the automobile. So this will be a celebration of both old and new. The highs and lows of automotive design. Form and function has been the balance of the truly great machines. Suggestions and submissions, especially images, are welcome.
